

Module - 1

Algorithm - definition.

Step by step procedure^{instruction} to solve problem domain

* Problem domain

Algorithm

• at the time of design

Program

• written at implementation stage

Algorithm is a step by step finite sequence of instructions to solve well defined computational problems.

Difference b/w algorithm & program

Algorithm

Program

• written at design time

• programs written at implementation

• designer should aware about problem domain

• program should aware of problem domain

• language independent

• language dependent such as c, c++, java, python etc

• independent of b/w & dw

• dependent on b/w & dw such as windows, ubuntu, hard disk, ram etc

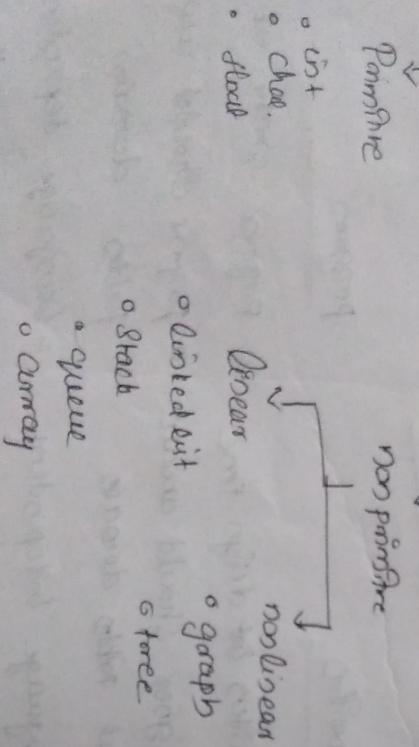

Characteristics

- o input - 0 or more value
- o output - atleast one value
- o definiteness - each instruction are clear & unambiguous
- o finiteness - steps are finite
- o effectiveness - Do something, avoid unnecessary step.

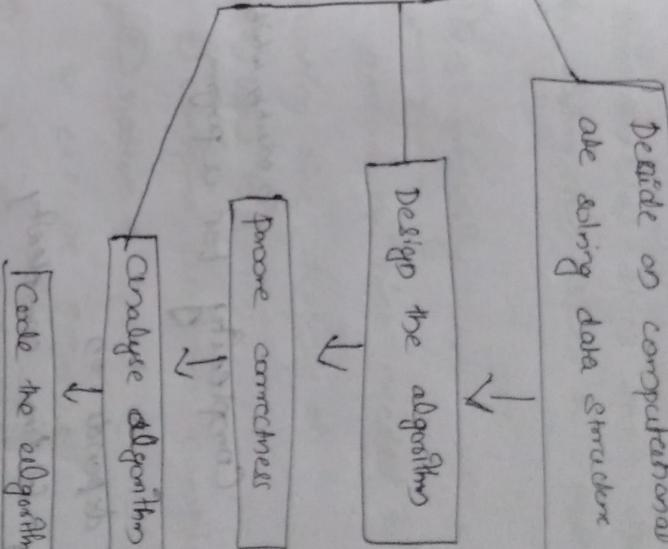

o Study of an algorithm involves 3 steps.

- ① algorithm design
- ② Proving the correctness of algorithm.
- ③ analysing the algorithm.

Data Structure - The way of organizing, managing & storing data is called

Algorithm design & analysis

understand the problem

decide on computational means exact vs approx
are solving data structure algorithms design techniques

- Some data structure resides inside other data structure and hides the structure just like
- Stack & queue - uses array / linked list

Operations on ds

- ① Execution
- ② Deletion
- ③ Traverse
- ④ Search
- ⑤ update
- ⑥ sorting
- ⑦ merging

Time & Space complexity

To estimate width of algorithm

- * The amount of time needed to run an algo for complete running time depends on
 - (*) Input to program
 - ② compiler used to compile program
 - ③ nature & speed of instruction in machine used to execute program.

Time & space trade off

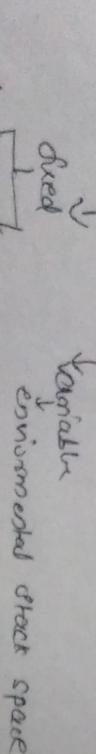

- o It is not possible to achieve these objectives such as time & space simultaneously.

The amount of memory needs to run an algo for completion.

Space complexity

The amount of memory needs to run an algo for completion.

Space

Instruction space. - Space needed to store executable version of a program.

+ Data space. - It stores constant variables

+ Environmental stack space. - Space needed to store the information about the partially completed process

Space at cost of time

out constrain, choose a program having less time to execute at the cost of more space.

Asymptotic notation

A Notation that enable us to make meaningful statements about time & space complexity of a program. This notation is called as asymptotic notation.

It describes the behaviour of time & space complexity of large instance characteristics. (Large numbers)

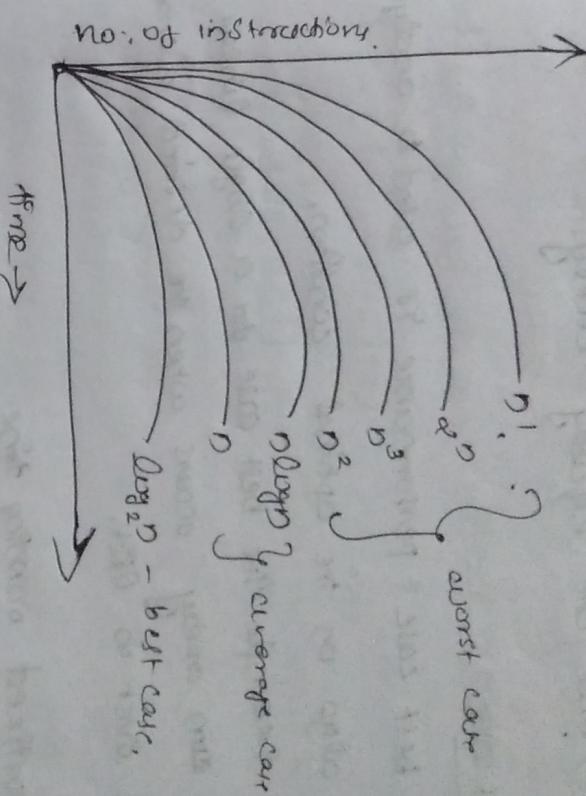

* Common asymptotic notations

function	name
*	1
*	constant
*	n
*	linear
*	$\log n$
$n \log n$	logarithmic
*	n^2
*	n^3
*	n^4
*	cubic
*	exponential
*	polynomial

Worst case, avg case, best case & amortized time complexity

worst case

- o This denotes the behaviour of an algo w.r.t. the worst possible case of input instance.
- o The worst case running time of an algo is an upper bound on the running time for any if

Average case

- o The avg case running time of an algo is an

- point c (1)
- Avg case running time assumed that all types of given size are equally likely.

Best case

- The best case performance is used to analyse an algo in the optimal condition.

- for example: The best case for a single linear search occurs when the desired element is the first in list.

Amortized running time

- It refers to the time required to perform a sequence of related operations averaged over all the operations performed. It guarantees the avg performance of each operation
- the worst case.

Analyzing time complexity to basic statements:

Add C) no of executions

$$\left\{ \begin{array}{l} a = 10; \\ b = 20; \\ c = a+b; \end{array} \right. \quad \begin{array}{l} (1) \\ (1) \\ (1) \end{array}$$

Add C)

$$\left\{ \begin{array}{l} S = 0; \\ \text{for } i=1; i \leq n; i++ \end{array} \right. \quad \begin{array}{l} (1) \\ (n+1) \end{array}$$

$$\left\{ \begin{array}{l} S = S + A[i] \\ \text{return } S \end{array} \right. \quad \begin{array}{l} (n) \\ (1) \end{array}$$

$$\text{Total} = 2n + 4 = n$$

$$\text{time} = O(n).$$

We have 2 types of algorithms.

① Iterative ② Recursive

→ If our algo contains loops such as for, while etc then such algo are called iterative eg: Add(C)

→ If a fn calls by fn contains recursive calls then it is called recursive algo.

o This method is called frequency count method.

o Another way of finding time complexity of n^3 is polynomial term using a rules:

1) Drop low order terms because they are not significant

2) Drop constant multipliers.

Eg: $2n^3 + 3n^2 + 4n + 6$.

$\Rightarrow n^3$

dropping coefficients

$\Rightarrow n^3$

\therefore Time complexity = $O(n^3)$

Eg: $f(n) = 10n^4 + 3n^2 + 4n + 8$

$\Rightarrow O(n^4)$

$f(n) = 16n + \log n$

$\Rightarrow O(n)$.

Time complexity analysis for loop

no of executions

Add ($a, b, \alpha_1, \alpha_2, c_1, c_2$)

{ for $i=0, j < c_1; i++$

$n+1$

{ for $j=0, j < c_2; j++$

n^2+1

{ for $k=0, k < c_1; k++$

n^3+1

Asymptomatic
Dokabor

Any δ can be expressed in 3 ways, such as

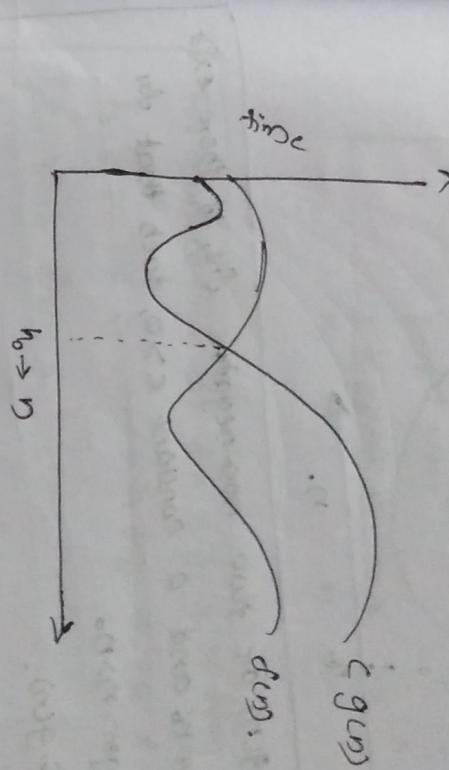

1) Big (0),

Bigob is used for expressing the upper bound of an

deposits occurring there.

of his measure at the longer

It appears to be the worst case of an algorithm.

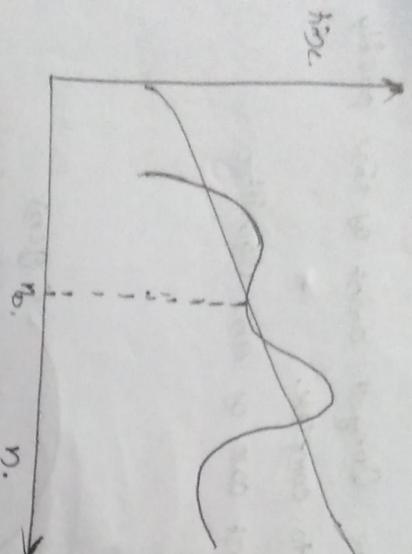

(b) and (c) are non-negative obs, if there exist an integer n_0 and a constant $c > 0$, such that for every integer $n > n_0$,

$$f(n) \leq c \cdot g(n).$$

This is denoted as $f(n) = O(g(n))$

* Omega notation (-n)

or \hat{y}_S used for expressing the lower bound of an algorithm or \hat{y}_B the \hat{y}_S used for representing the best case of an

$f(n)$ and $g(n)$ are two non-negative functions, if there exist an integer n_0 and a constant $c > 0$, such that for every integer $n > n_0$

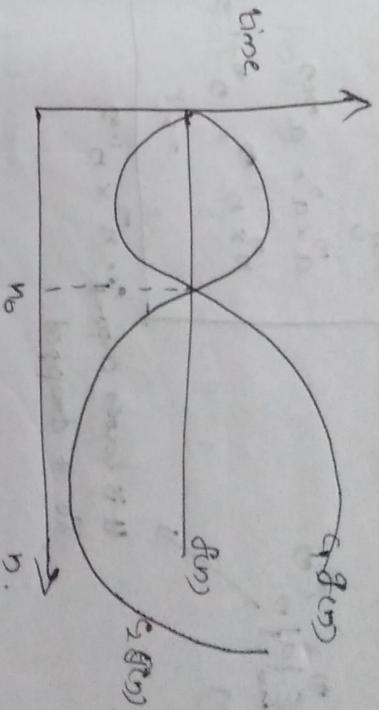

$$f(n) \geq c g(n).$$

This is denoted as $f(n) = \Omega(g(n))$

The theta notation (Θ)

If the $f(n)$ is both lower & upper bound then we do so denoted by Θ notation

o It also represent avg case of an algorithm.

For non-negative $f(n)$ & $g(n)$ & there exist an integer n_0 & positive constant c_1 & c_2 & $\epsilon > 0$ such that

- for every integer $n > n_0$

$$c_1 g(n) \leq f(n) \leq c_2 g(n)$$

This is denoted as $f(n) = \Theta(g(n))$

Theorem

$$f(n) = \Theta(g(n))$$

(A) If $f(n) = a_m n^m + \dots + a_1 n + a_0$ and $a_m > 0$,

$$\text{then } f(n) = \Theta(n^m)$$

(B) Proof
f(n) is a to do or statement
 $a_m > 0$ means value of $n^m > 0$

$$f(n) \leq \sum_{i=0}^m |a_i| n^i$$

$$\leq n^m \sum_{i=0}^m |a_i| n^i$$

$$a^m \cdot a^n = a^{m+n}$$

$$n^m \cdot n^{l-m} = n^m \cdot n^{l-n}$$

$$= n^l$$

$$\leq O(n^l)$$

\downarrow

It is lower bound: $n^m \times n^{l-m}$

So it dropped

put $n=1$

$3n+2 \leq 4n$

$5 \leq 4$; cond' fails

put $n=2$

$8 \leq 8$, cond' fails

$n=2$

Asymptotic notation big O problem

(A)

$$1 < \log n < \sqrt{n} < n < \log n < n^2 < n^3 < \dots < n^a$$

\Rightarrow growth order

\downarrow
lower bound average.

(B) $f(n) = O(g(n))$

(a) $f(n) = 3n+2$, find $f(n) = O(n)$

(A) Assume $f(n) = O(n)$

$f(n) \leq c \cdot g(n)$

put $c=1$, $f(n) \leq c \cdot g(n)$

$3n+2 \leq n$, condition fails

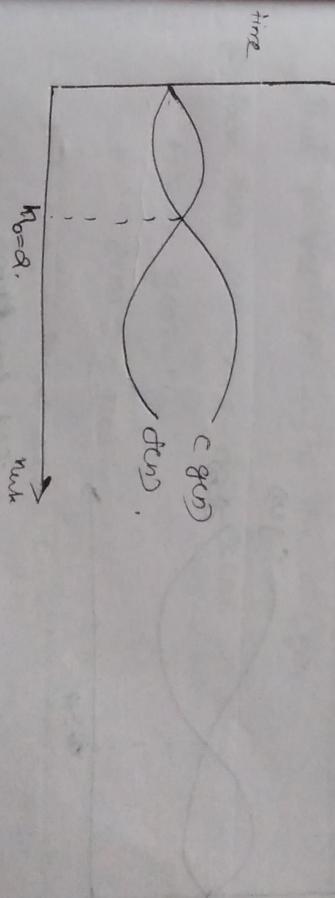

$c=2$, $f(n) \leq c \cdot g(n)$, $3n+2 \leq 2n$, condition fails

$c=3$, $3n+2 \leq 3n$, condition fails

$f(n) = O(n)$

$f(n) \leq c \cdot g(n)$

$5 \leq 4$; cond' fails

(B) Given that $f(n) = 4n^3 + 2n + 3$. Find $f(n) = O(n)$.

Assume $f(n) = O(n^3)$

$f(n) \leq c \cdot g(n)$

put $c=1$

$$4n^3 + 2n + 3 \leq 5n^3, \text{ condition fails.}$$

$$\text{put } c=2, 4n^3 + 2n + 3 \leq 2n^3, \text{ condition fails.}$$

$$\text{put } c=3, 4n^3 + 2n + 3 \leq 3n^3, \text{ condition fails.}$$

$$\text{put } c=4, 4n^3 + 2n + 3 \leq 4n^3 \text{ condition fails.}$$

$$\text{put } c=5, 4n^3 + 2n + 3 \leq 5n^3 \text{ condition satisfies}$$

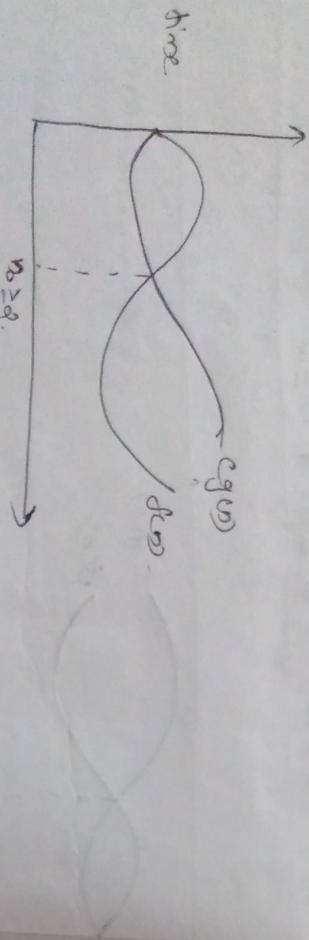

$$\text{put } n^3 = 1$$

$$1+2+3 \leq 5$$

$$n=2 \quad 4 \times 2^3 + 2 \times 2 + 3 \leq 5 \times 2^3$$

$$39 \leq 40$$

$$\therefore n \geq 2.$$

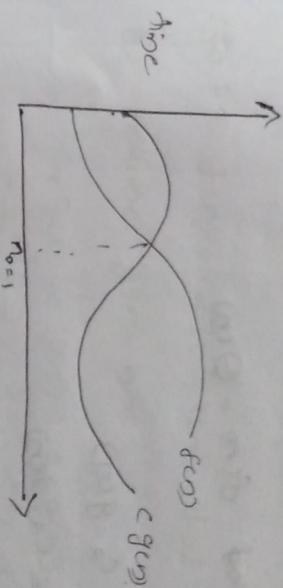

put $c=1$

$$2n^2 + n + 3 \geq n^2, \text{ condition satisfies}$$

$$\text{put } n=1$$

$$2+1+3 \geq 1, \text{ condition true.}$$

$$\therefore n = \underline{\underline{1}}$$

Thus, proved $f(n) = \omega(n)$ for $c=1, n_0 \geq 1$

(Q) Prove that $f(n) = \Omega(n)$ and $\Omega(n)$.

$$\text{Assume } g(n) = n$$

$$f(n) \geq c g(n).$$

$$\text{put } c=1, 3n + 2 \geq n \text{ condition true.}$$

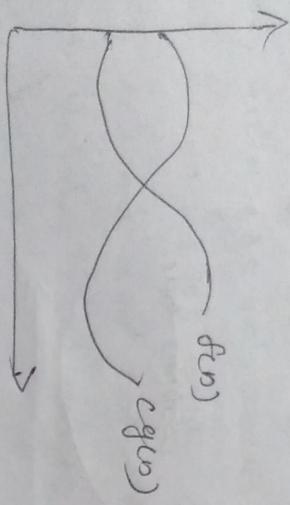

$$\therefore c=1, n_0=1$$

(A) Assume $g(n) = n^2$

$$f(n) \geq g(n)$$

(Q) Prove that $f(n) = \Omega(n^2 + n + 3)$, find $f(n) = \Theta(n^2)$

Thus proved $f(n) = \Theta(n)$ for $n \geq 1$ & c_{21}

5) If $f(n) = 3n+2$ find $f(n) = \Theta(n)$

(A) Assume, $g(n) = n$

$$c_1 g(n) \leq f(n) \leq c_2 \cdot g(n)$$

$$c_1 g(n) \leq 3n+2 \leq c_2 \cdot g(n)$$

Or putting values $1, 2, \dots$, for both c_1, c_2 we get

$$2n \leq 3n+2 \leq 4n$$

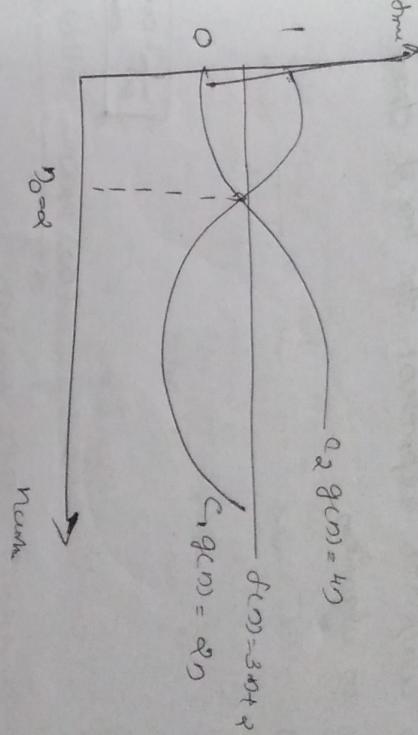

put $n=0$, $0 \leq 2 \leq 0$ false

put $n=1$ $2 \leq 5 \leq 4$, cond false

put $n=2$ $4 \leq 8 \leq 8$, cond true

Thus proved

$$f(n) = \Theta(n) \quad \forall c_1 = 2, c_2 = 4 \quad n \geq 2$$

(B) PT $f(n) = 2n^2 + 16n$, find Θ

Assume $g(n) = n^2$

$$c_1 g(n) \leq f(n) \leq c_2 \cdot g(n)$$

$$c_1 g(n) \leq 2n^2 + 16n \leq c_2 \cdot g(n)$$

$$26n^2 \leq 2n^2 + 16n \leq 28n^2$$

$$\therefore c_1 = 26, c_2 = 28$$

put $n=0$, $0 \leq 0 \leq 0$. cond true

put $n=1$, $0 \leq 0 \leq 0$. cond true

put $n=2$, $4 \leq 8 \leq 8$, cond true

Thus proved

$$f(n) = \Theta(n) \quad \forall c_1 = 26, c_2 = 28, n \geq 0$$

There are 5 ways to represent the tree of space

Complexity of an algorithm

(1) Big O (O)

(2) Big- Ω

(3) Theta

(4) Little O (o)

(5) Little ω .

Little O (o)

o to find loose upper bound
theorem to find out Little o.

If $f(n) \leq g(n)$ be a Θ function such that

$$\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = 1 \text{ exist, then } f(n) = \Theta(g(n)) \text{ or}$$

~~$f(n) \neq \Theta(g(n))$~~

$$\boxed{\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = 1 \text{ or any constant}}$$

ex: $f(n) = n^2$, $g(n) = n^3$. Check whether $f(n) \neq \Theta(g(n))$

$$(A) \lim_{n \rightarrow \infty} \frac{n^2}{n^3} = \lim_{n \rightarrow \infty} \frac{1}{n} = \frac{1}{\infty} = 0 \text{ / constant}$$

Thus proved that $f(n) \in \Theta(g(n))$

$$\boxed{\frac{1}{n} = \text{const}}$$

Little omega (ω)

o we need to find out loose lower bound.

o Big Omega (Ω) may represent exact order of growth
but Little omega (ω) denote a loose lower bound

that's not asymptotically tight

o If $f(n) \in \omega(g(n))$ it and only if

$$\boxed{\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = \infty}$$

Problem

(B) $f(n) = 4n+6$ $g(n)=1$ Check whether $f(n) \neq \Theta(g(n))$

$$\lim_{n \rightarrow \infty} \frac{4n+6}{1} = 4n+6 = \infty$$

Thus proved that $f(n) \in \omega(g(n))$

$$\begin{aligned} \lim_{n \rightarrow \infty} \frac{4n+6}{n^2} &= \lim_{n \rightarrow \infty} \frac{4n}{n^2} + \lim_{n \rightarrow \infty} \frac{6}{n^2} \\ &= \lim_{n \rightarrow \infty} \frac{4}{n} + \lim_{n \rightarrow \infty} \frac{6}{n^2} = \frac{4}{\infty} + \frac{6}{\infty} = 0 \end{aligned}$$

$$\lim_{n \rightarrow \infty} \frac{4n+6}{n^2} = 0$$

$$4n+6 = \infty$$

(C) $f(n) = 7n+8$, $g(n)=n^2$, find check whether $f(n) \in \Theta(g(n))$

Asymptotic properties

4 main properties

(1) Reflexive (2) transitive (3) Symmetric (4) transitive

(1) Reflexive
If $f(n)$ is a Θ then $f(n) = \Theta(f(n))$

If $f(n) = \Theta(g(n))$ if and only if $g(n) = \Theta(f(n))$.
 $f(n) = \Theta(g(n))$
 $f(n) = \Theta(g(n))$

ex: $f(n) = n$.

$f(n) = O(n) = \Omega(n) = \Theta(n)$.

(2) Transitive.

If $f(n) = O(g(n))$ and $g(n) = O(h(n))$ then

$f(n) = O(h(n))$.

ex: $f(n) = n$, $g(n) = n^2$, $h(n) = n^3$. By transitive property

$$f(n) = O(n^2)$$

$$g(n) = O(n^3)$$

$$\boxed{a=b \\ b=c \\ a=c}$$

* If $f(n) = O(g(n))$

(3) Symmetry
o Symmetry property true for Θ . only

o If $f(n) = \Theta(g(n))$ if and only if $g(n) = \Theta(f(n))$
 ex: $f(n) = n^2$, $g(n) = n^2$ then $g(n) = n^2$

(4) Transpose

o If $f(n) = O(g(n))$ if and only if $g(n) = \Omega(f(n))$.
 o Transpose property true for O & Ω .

ex: $f(n) = n$ & $g(n) = n^2$ then $f(n) = O(n^2)$ & $g(n) = \Omega(n^2)$

General properties for asymptotic

(1) If $f(n) = O(g(n))$ then $a \times f(n) \leq O(g(n))$.

If n is true for O & Ω

(2) Prove that If $f(n) = 3n^2 + 2$ is $O(n^2)$ if $a=5$

$$f(n) = 3n^2 + 2$$

$$a \times f(n) = 5(3n^2 + 2) = 15n^2 + 10 \Rightarrow O(n^2)$$

(3) Addition | manipulation property

If $f(n) = O(g(n))$ and $d(n) = O(e(n))$ by manipulation

property $f(n) + d(n) = O(\max(g(n), e(n)))$

(4) $f(n) = O(n)$, $g(n) = O(n^2)$ find $\sum f(n) + g(n)$.

$$\begin{aligned} f(n) + d(n) &= O(\max(g(n), f(n))) = O(\max(n, n^2)) \\ &= O(n^2) \end{aligned}$$

(3) Multiplicative property

If $f(n) = O(g(n))$ & $d(n) = O(h(n))$ then $f(n) \times d(n) = O(g(n) \times h(n))$

$$(1) f(n) = 10 \quad g(n) = n^2$$

$$f(n) \times g(n) = O(10n \times n^2) = O(n^3)$$

Log formulas

- * $\log_a a = 1$
- * $\log_a 1 = 0$
- * $\log_m ab = \log_m a + \log_m b$
- * $\log_m a/b = \log_m a - \log_m b$.
- * $\log_m a^b = b \log_m a$

$$\log_2 1 = 0$$

$$(4) \text{ Soln } T(n) = \begin{cases} 1 & \text{if } n=0 \\ T(n-1) + 1 & n>0 \end{cases}$$

$$T(n) = T(n-1) + 1$$

$$= T[(n-2)+1] + 1$$

$$= T(n-2) + 2.$$

$$= T[(n-3)+1] + 2$$

$$= T(n-3) + 3.$$

$$= T[(n-4)+1] + 3$$

$$= T(n-4) + 4$$

$$\vdots$$

$$= T(n-k) + k$$

$$= T(n) + D$$

$$\therefore n-k=0 \Rightarrow n=k$$

30/11/12) Recurrence

- o The way to find out the time complexity of recursive algorithm is known as recurrence relation.
- o 4 methods to find out the recurrence relation.

- (1) Substitution method.
- (2) Iteration method

- (3) Recursion-tree method

- (4) Master's theorem

$$(Q) \quad T(n) = \begin{cases} 1, & \text{if } n=0. \\ T(n-1)+n, & \text{if } n \geq 1. \end{cases}$$

$$\begin{aligned} &= T(n-1)+n \\ &= T[(n-1)+n] \\ &= T[(n-2)+n-1]+n \end{aligned}$$

$$\begin{aligned} &= T(n-2)+n-1 \\ &= T(n-3)+3n-3 \\ &= T(n-4)+2n-4 \end{aligned}$$

$$\begin{aligned} &= T(n-1-2+2(n-1)) \\ &= T(n-3)+2n-2-1 \\ &= T(n-3)+2n-3, \end{aligned}$$

$$= T(0) + T(1) + T(2) + \dots + T(n)$$

$$\begin{aligned} &= T(n-1-3)+3(n-1) \\ &= T(n-4)+3n-3-3 \\ &= T(n-4)+3n-6+6 \end{aligned}$$

$$= T[(n-2)+n-1]+n$$

$$= T(n-2)+n-1$$

$$= T(n-3)+3n-3$$

$$= T(n-4)+2n-4$$

$$= T(n-1-2+2(n-1))$$

$$(Q) \quad T(n) = \begin{cases} \alpha & \text{for } n=0, \\ \alpha + T(n-1) & \text{for } n>0. \end{cases}$$

$$T(n) = \alpha + T(n-1)$$

$$\begin{aligned} &= \alpha + (\alpha + T(n-2)) \\ &= 2\alpha + (\alpha + T(n-3)) \end{aligned}$$

$$\begin{aligned} (Q) \quad T(n) &= \begin{cases} 1 & \text{if } n=0, \\ T(n-1)+n & \text{if } n \geq 1. \end{cases} \\ T(n-1) &= \\ &= T(n-1-1)+n-1 = T(n-2) \end{aligned}$$

$$\begin{aligned} &= T[(n-2)+n-1]+n \\ &= T[(n-3)+2n-2]+n \\ &= T[(n-4)+3n-3]+n \end{aligned}$$

$$\begin{aligned} &= T(n-1-1)+n-1 = T(n-2) \\ &= T(n-2)+n-1 = T(n-3) \\ &= T(n-3)+n-2 = T(n-4) \end{aligned}$$

$$\begin{aligned} &= T(n-1-2+2(n-1)) \\ &= T(n-3)+2n-2-1 \\ &= T(n-3)+2n-3 \\ &= T(n-4)+2n-4 \end{aligned}$$

$$\begin{aligned} &= T(n-1-3)+3(n-1) \\ &= T(n-4)+3n-3-3 \\ &= T(n-4)+3n-6+6 \end{aligned}$$

$$\begin{aligned} &= T(n-1-4+2(n-1)) \\ &= T(n-5)+3n-5-1 \\ &= T(n-6)+3n-6+6 \end{aligned}$$

Substitution method for solving recurrence in a step

① Guess the form of the solution ie

$$T(n) = O(g(n))$$

② Use mathematical induction to find constant c, n_0 in the form and show that solution works.

Step-1: Base step

Show that the guess is true for initial value.

Step 2: Inductive step.

Show that if the guess is true for $T(k) \leq c \cdot g(k)$

for all $k < n$. Then this imply that $T(n) \leq c \cdot g(n)$ for

some $c > 0, n > n_0$.

Prob2.

① Solve the following recurrence relation using substitution method.

$$T(n) = \begin{cases} 1, & n=1 \\ 2T(\lceil \frac{n}{2} \rceil) + b, & n>1 \end{cases}$$

Guess upperbound

$$T(n) = O(n \log n)$$

$T(n) \leq c \cdot n \log n$ for some constant $c > 0$.

Hypothesis: For any value k $T(k) \leq c k \log k$ for $k < n$. Here $k = \lceil \frac{n}{2} \rceil, n_0 \leq 1$.

Inductive Step: $T(n) = 2T(\lceil \frac{n}{2} \rceil) + b$.
Substitute our hypothesis in the recurrence equation and prove that it is true for value k then it is true for value n .

Plug in n_0 to our hypothesis.

$$T(n) = 2T(\lceil \frac{n}{2} \rceil) + b$$

$$\leq 2c \lceil \frac{n}{2} \rceil \log \lceil \frac{n}{2} \rceil + b$$

$$\leq c [b \log(\lceil \frac{n}{2} \rceil)] + b$$

$$\leq cn \log n \leq c n \log 2 + b$$

$$\leq cn \log n - (c_0 + b)$$

$$= \underline{\underline{cn \log n}}$$

Thus proved that the result got from hypothesis should be less than or equal to $n \log n$.
Hence our guess solution $\log n$ is correct. So $T(n) = O(n \log n)$ is true for recursively calling sorting such as merge sort & quick sort.

$$\log 2 = 1$$

$$(A) T(n) = \begin{cases} 1, & n=1 \\ 2 + (n/2) + D & \text{if } n>1 \end{cases}$$

$$\text{Guess } T(n) = O(n).$$

(A) Guess upper bound $T(n) = O(n)$ or

$$T(n) \leq cn \quad \text{for some constant } c.$$

Hypothesis : For any value of k

$$T(k) \leq ck, \text{ for } k \in \mathbb{N}. \text{ Here } k = n/2, n/2 \leq n.$$

Inductive step : $T(n) = 2 + (n/2) + D.$

Plug into $n/2$ into our hypothesis

$$T(n) = 2 + ((n/2)/2) + D$$

$$\leq 2c(n/2) + D$$

$$\leq cn + D$$

$$= cn + D, \text{ which is not equal to } cn.$$

The above inequality does not hold because

$c+1$ can't be less than c . Hence $T(n) \neq O(n)$. So

our guess $O(n)$ is not a solution for merge sort or quick sort.

10/12/21 Merge Cost.

MERGE-SORT (A, P, Q)

$A \Rightarrow$ array
 $P \Rightarrow$ positions of selected
 $Q \Rightarrow$ positions of last elements

1. If $P < Q$
2. Then $q_L \leftarrow \lceil (P+Q)/2 \rceil$

3. MERGE-SORT (A, P, q_L)

4. MERGE-SORT (A, q_L+1, Q)

5. MERGE (A, P, q_L, Q)

ex: P_1	2	3	4	5	6	7	8	9
1	5	7	8	2	4	6	9	7

1) $R \leftarrow A$
 2) find the mid

Procedure for merge

MERGE (A, P, Q)

1. $D_1 \leftarrow P - P + 1$

2. $D_2 \leftarrow Q - Q$

3. Create arrays $L [C_1, \dots, C_{n+1}]$ and $R [1, \dots, n_2 + 1]$

4. For $i \leftarrow 1$ to D_1

5. do $L[i] \leftarrow A [P + i - 1]$

6. For $j \leftarrow 1$ to D_2

7) do $R[i:j] \leftarrow A[q:t]$

8) $L[i_1:i_2] \leftarrow \infty$
 $R[i_2+1:j] \leftarrow \infty$

9) $i \leftarrow i_1$
 $j \leftarrow i_2$

10) for $k \leftarrow p$ to n.

11) do if $L[k] \leq R[j]$

12) then $A[k] \leftarrow L[i]$

13) $i \leftarrow i+1$

14) else $A[k] \leftarrow R[j]$

15) $j \leftarrow j+1$

1	5	7	8	2	4	6	9
---	---	---	---	---	---	---	---

16) $\boxed{1 \ 5 \ 7 \ 8 \ 2 \ 4 \ 6 \ 9}$

STRASSEN'S MATRIX MULTIPLICATION

```
for (i=0; i<n; i++)  
for (j=0; j<m; j++)  
    pointf (" %d ", &a[i][j])  
for (i=0; i<n; i++)  
for (j=0; j<c; j++)  
    pointf (" %d ", &b[i][j])  
if (n == c) {  
    for (i=0; i<n; i++)  
        for (j=0; j<c; j++)  
            for (k=0; k<c; k++)  
                d[i][j] = (d[i][j] + a[i][k]*b[k][j]);  
}  
pointf (" %d ", d[i][j]);
```

Given 2 square matrices A & B of size $n \times n$

$$A = \begin{bmatrix} 1 & 3 \\ 5 & 7 \end{bmatrix} \quad B = \begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}$$

We have 3 methods for solving matrix multiplication

- (i) Naive method
- (ii) Divide and conquer
- (iii) Strassen's matrix multiplication.

(i) Naive method

Time complexity is $O(n^3)$ because it contains 3 loops.

(ii) Divide and conquer method

Divide matrix A & B into 4 submatrix of size $n/2$. A, B, C are square matrix of size $n \times n$, then

$$\begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}$$

are submatrix of A having size $n/2 \times n/2$.

$A_{11}, A_{12}, A_{21}, A_{22}$ be the submatrix of B having size $n/2 \times n/2$.

$$\begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix} = \begin{bmatrix} C_{11} & C_{12} \\ C_{21} & C_{22} \end{bmatrix}$$

$$AB = \boxed{\quad}$$

method
{ for $i=0; i<n; i++$
 { for $j=0; j<m; j++$
 { for $k=0; k<n; k++$
 { $C[i][j] = C[i][j] + A[i][k] * B[k][j]$ } } } }

$$a_{11} = A_{11}B_{11} + A_{12}B_{21}$$

$$C_{12} = A_{12}B_{12} + A_{22}B_{22}$$

$$C_{21} = A_{21}B_{11} + A_{22}B_{21}$$

$$C_{22} = A_{21}B_{12} + A_{22}B_{22}$$

The recursive matrix multiplication gives 8 multiplications and 4 addition (means addition of matrix). So the time complexity for divide and conquer approach of matrix multiplication is

$$T(n) = 8T(n/2) + n^2$$

Using master's theorem

$$a=8, b=2, k=2$$

$$b^k = 2^2 = 4$$

$$a > b^k$$

$$T(n) = \Theta(n \log_b a) \Rightarrow O(n \log_2 8)$$

$$O(n \log_2 2^3)$$

$$T(n) = \Theta(n \log_b a)$$

$$= O(n \log_2 T)$$

Strassen reduce the no: of recursive call to 7 so be design a formula,

$$P = (A_{11} + A_{22}) : (B_{11} + B_{22})$$

$$S = (A_{22} - A_{12}) B_{21}$$

$$R = A_{11} (B_{12} - B_{22})$$

$$L = A_{22} (B_{21} - B_{11})$$

$$Q = (A_{11} + A_{12}) B_{22}$$

$$U = (A_{21} - A_{11}) (B_{11} + B_{12})$$

$$V = (A_{12} - A_{22}) (B_{21} + B_{22})$$

$$C_{11} = P + S - Q + V$$

$$C_{12} = R + T$$

$$C_{21} = Q + S$$

$$C_{22} = P + R - Q + V$$

Time complexity of Strassen is $T(n) = 7T(n/2) + d$.

Here, 7 multiplication and 18 additions and subtractions. So by using master's theorem

$$a=7, b=2, k=2$$

$$b^k = 2^2$$

$$a > b$$

$$T(n) = \Theta(n \log_b a)$$

$$= O(n \log_2 7)$$

$$\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{bmatrix} = \underline{\underline{O(n^2 \cdot 807)}}$$

Quick Sort

Quick Sort is a recursive algorithm that follows divide and conquer approach in best case and average case. Time complexity of best case quick sort is $O(n \log n)$ and time complexity of worst case is $O(n^2)$.

Given an array, take any element from the array and call it as pivot value and put that pivot value in a position such a way that elements lesser than pivot value is left hand side and

elements greater than pivot is RHS. Now we have 2 sublists and perform recursively quicksort for each sublists.

Partition procedure

- Increment i until found a value greater than or equal to pivot.

- Decrement j until found a value lesser than pivot.

- Exchange i^{th} & j^{th}

- Whenver $i < j$ causes then we swap i^{th} position with pivot value.

Step(i) : Take 10 as the pivot element.

(i)	<table border="1"> <tr> <td>10</td><td>16</td><td>8</td><td>5</td><td>9</td><td>20</td></tr> </table>	10	16	8	5	9	20
10	16	8	5	9	20		

i increments and j decreases.

$$(ii) \quad i > p \Rightarrow 8 > 10 - F$$

$$i+1 \Rightarrow i=5$$

10	9	8	5	16	20
----	---	---	---	----	----

$$j < p \Rightarrow 9 < 10 - F$$

$$i+1 \Rightarrow i=16, \quad i > p \Rightarrow 16 > 10$$

10	9	8	5	16	20
----	---	---	---	----	----

$$j-1 \Rightarrow j=5, \quad j < p, \quad j=5$$

$$j > p \Rightarrow 5 > 10 - F$$

$$i+1 \Rightarrow i=16, \quad i > p \Rightarrow 16 > 10$$

$$j-1 \Rightarrow j=5, \quad j < p, \quad j=5$$

10	9	8	5	16	20
----	---	---	---	----	----

Swap the pivot with j

5	9	8	10	16	20
---	---	---	----	----	----

LHS of pivot is less

RHS of pivot is greater.

$$f_{\text{min}} = 5 \text{ Hz}$$

2. Apply quicksort to the following elements.

10, 16, 8, 12, 15, 6, 3, 9, 5

9	10	11
9	10	11

5	9	8	10	16
---	---	---	----	----

—
C

$$i > p \Rightarrow q > s - p$$

$$E = C / g = 57^\circ$$

卷之三

Quick Sort

Quick Sort is a recursive algorithm that follows divide & conquer approach is best case & average case. Time complexity of quicksort is best case $O(n \log n)$ and in average case, $O(n \log n)$. Worst case - $O(n^2)$.

Given an array, take any element from array

$$i=0, j=1$$

2	8	7	1	3	5	6	4
---	---	---	---	---	---	---	---

$$i=0, j=2$$

2	8	7	1	3	5	6	4
---	---	---	---	---	---	---	---

$$8 \leq 4$$

No interchange

$i=1, j=3$

2	8	7	1	1	3	1	5	6	1	4
i	j									

$i=1, j=4$

2	8	7	1	1	3	1	5	6	1	4
i	j									

$i \leq 4$.

$i++ \rightarrow A[5]$

$i=2, j=4$

2	1	1	8	1	3	1	5	6	1	4
i	j									

$i=2, j=5$

2	1	1	8	1	3	1	5	6	1	4
i	j									

2	1	1	7	8	3	1	5	6	1	4
i	j									

$3 \leq 4$.

2	1	1	7	8	3	1	5	6	1	4
i	j									

$i++ \rightarrow A[5]$

2	1	1	8	1	7	5	1	6	1	4
i	j									

$5 \leq 4$

$i=3, j=7$

as no increment, no swap

2	1	1	8	1	7	5	1	6	1	4
i	j									

$6 \leq 4$

as no increment, no swap

2	1	1	8	1	7	5	1	6	1	4
i	j									

$i=3, j=8$.

we can't fix pivot

2	1	3	4	7	1	5	6	1	8
i	j								

Quicksort C, A, P, Q - O

Quicksort C, A, Q, P, O

Time complexity of quicksort algorithm using substitution method

$$T(n) = \begin{cases} 2T(n/2) + O(n), & \text{if } n > 1 \\ O(1) & \text{if } n \leq 1 \end{cases}$$

Using Master's theorem.

$$T(n) = 2T(n/2) + O(n)$$

$$\begin{aligned} a &= 2, & b &= 2 \\ k &= 1, & p &= 0 \quad (\text{Property 2, case 1}) \end{aligned}$$

$$b^k = 2^1 = 2$$

$$T(n) = \Theta(\log_b n) = \Theta(\log_2 n)$$

$$\begin{aligned} &= \Theta(\log^2 \log n) \\ &= \Theta(\log \log n) \end{aligned}$$

Master's theorem

$$\text{If } T(n) = aT(n/b) + \Theta(n^k \log^p n)$$

$a > 1, b > 1, k \geq 0$ and p is real number

Properties

$$\text{a) If } p > -1, \text{ then } T(n) = \Theta(n \log^a \log^{p+1} n)$$

$$\text{b) If } p = -1, \text{ then } T(n) = \Theta(n \log^a \log \log n)$$

$$\text{c) If } p < -1, \text{ then } T(n) = \Theta(n \log^a n)$$

$$\text{d) If } a < b^k \text{ then}$$

$$\text{e) If } p \geq 0, \text{ then } T(n) = \Theta(n^k \log^p n)$$

$$\text{f) If } p < 0, \text{ then } T(n) = \Theta(n^k)$$

$$\begin{aligned} (\log n)^2 &= \log n \times \log n \\ (\log^2 n) &= \log \log n \end{aligned}$$

$$\begin{aligned} \log^0 n &= 1 \\ \log_2 2 &= 1 \end{aligned}$$

$$\text{g) } T(n) = 3T(n/2) + n^2$$

$$a = 3, \quad b = 2, \quad k = 2, \quad p = 0$$

$$\begin{aligned} b^k &= 2^2 \\ a &< b^k \end{aligned}$$

$$3 < 2^2 \quad (\text{Property 3, case 1})$$

$$\boxed{\log_0 = 1}$$

$$\begin{aligned} T(n) &= \Theta(n^2 \log^0 n) \\ &= \Theta(n^2) \end{aligned}$$

Master's theorem

(i)

(j)

(k)

(l)

(m)

1) If $a > b^k$, then $T(n) = \Theta(n \log^a \log^{p+1} n)$

$$a = 2, \quad b = 2, \quad k = 1, \quad p = 1$$

$a = b^k$ (Property 2, case 1)

$$T(n) = \Theta(\log_b n \log^{k+1} n)$$

$$= \Theta(\log_2^2 \log^m n)$$

$$= \Theta(\log^2 n) = \Theta(n \log \log n)$$

$$\text{Q3)} T(n) = 5T(n/4) + n^2$$

$$a=5, b=4, k=2, p=0, b^k=4^2$$

$$5 < 4^2 \quad (\text{Property 3, case 3})$$

$$T(n) = \Theta(n^2 \log^p n)$$

$$= \Theta(n^2 \times \log^0 n)$$

$$= \underline{\underline{\Theta(n^2)}}$$

$$\text{4)} \quad T(n) = T(n/2) + n^2$$

$$a=1, b=2, k=2, p=0$$

$$b^k = 2^2$$

$$1 > 2^2 \quad (\text{Property 1})$$

$$T(n) = \Theta(\log_b n)$$

$$= \Theta(\log_2 n)$$

$$= \underline{\underline{\Theta(\log_2 n)}}$$

$$5) \quad T(n) = 2T(n/2) + \frac{n}{\log_2 n}$$

$$T(n) = 2T(n/2) + n \log_2 n$$

$$a=2, b=2, k=1, p=-1$$

$$a = b^k \quad (\text{Property 3, case 3})$$

$$T(n) = \Theta(\log_b n \log \log n)$$

$$= \Theta(\log_2 \log \log n)$$

$$= \Theta(\log \log n)$$

$$= \underline{\underline{\Theta(\log^2 n)}}$$
